## TYPES OF RECHARGE

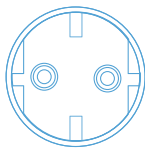

### Private Recharge

Private recharge allows you to recharge your vehicle in your garage or in the car park of your workplace. Thanks to the current European regulation, it is possible to install a charging socket or a wall box. All the domestic recharging solutions are safe and fully respect the normal domestic electric usage. Our consultants will advise you on the recharging solution that better suits your mobility needs and the energy rating of your home.

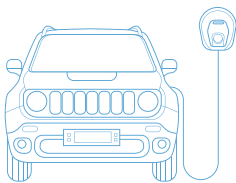

There are 3 solutions of private recharging:

1

**Standard recharging socket:** a recharging plug to which you can connect the cable supplied with the vehicle and in one night you can recharge your vehicle by yourself, with enough autonomy to satisfy the majority of the daily needs (plug in full recharge - electric not complete)

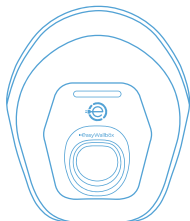

2

**Domestic Tool:** an option available with all the electric FCA vehicles which allows you to recharge your car faster and in total safeness. It is a power converter which allows you to recharge a plug in vehicle in less than 4 hours and a full electric in less than 10 hours, which equal to one night.

3

**Wall Box:** it is a current transformer that can handle higher powers such as to provide full recharge for a full electric vehicle in less than 8 hours and a plug-in in less than 2 hours. With Leasys it is possible to request, as an additional service, easyWallbox, the plug & play charging system easy to connect that allows you to recharge your vehicle fast from your home. Just connect it to the socket like any household appliance, it does not require any particular installation or upgrades to the electrical network.

## Public Recharge

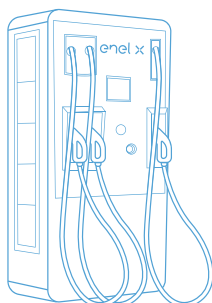

Leasys lets you access to the public charging network. On national territory you will find two different types of charging points:

1

**Standard Charging Point:** with two charging plugs, each one of 22 kWhs in alternating current. Full electric vehicles will fully recharge in around one hour. Each customer will receive a connector for public charging.

2

**Advanced charging point:** with more plugs allows, in addition to the «quick charge» enhanced alternate current, the continuous recharge (up to 50 kWhs) which allows you to fully charge your vehicle in only 30 minutes (fast charge). For recharging at this kind of charging point, the charging cable will not be necessary because it is already integrated in it.

For each rented vehicle, the customer will get 2 cables included: one for home charging and one for public charging. The customer will also receive a card to recharge at public network. Both charging points will be bookable and manageable through App.
